
YUCA (ACARUS, UNISON; SLURM, 64-core AMD EPYC nodes):

n = 12	1.64×10^{11} graphs	8 min	448 CPU	row 12 of the table ($\mathbb{Z}_2$-acyclic = I_S)
n = 13	2.10×10^{13} graphs	7 h 10 min	448 CPU	200,000 slices → 1 stuck graph ($H_1 = \mathbb{Z}/3$)
n = 14, K_4-free	6.49×10^{13} graphs	≈ 33 h	896 CPU, 2 accounts	2,000,000 slices → 51 stuck graphs
